

- **Create a Food billing system**

Make sure each business logic is denoted with appropriate comments and make your code interactive and represent clean and clear output on your console screen.

Adhere to the coding principles

Firstly, display the food items available

Then after the user can choose any of the item displayed

Also take the quantity of selected food item by the customer, then ask the user that he/she wanna select more?

If yes then again display the food items available and take an order from the customer. Here, you have to consider the total bill as the price of food items previously selected plus the price of new items added should display as a whole bill.

If no then display the final bill on the screen

Example of such system id given below :

```
1.Pizza      price = 180rs/pcs
2.Burger     price = 100rs/pcs
3.Dosa       price = 120rs/pcs
4.Idli       price = 50rs/pcs
Please Enter your choose... :1

You have selected pizza.
Enter the quantity :2
Amount : 360
Total Amount is = 360
Do you want place more orders ? y & n :y
----- Menu -----
1.Pizza      price = 180rs/pcs
2.Burger     price = 100rs/pcs
